

Dear customer!

Your MyGIG has been Converted from RER to REW, this includes full radio frequencies, European database, Multi Language settings, TMC etc. First time you install a MyGIG in a car it will ask for Security Code, press "1234" (our previous code was 1111). If you get it wrong 3 times you have to wait for 30 minutes.

Important: As the MyGIG now has the European standard specification it also get the "ANTI THEFT". This means that first time you install the MyGIG it will marry the with the cars "VIN" number, if you want to change the MyGIG unit to another car you will be asked to press the Security Code again for the MYGIG to re-marry with the new car.

The Version of the OS software can be up or downgraded. You may run any version. The conversion will not be affected. Usually we return the MYGIG with the latest stable OS.

Important: If your car have a VES (Vehicle Entertainment system)... some times called MediaCenter. You must drive to a Chrysler garage and adjust the VES-region settings in the CANbus system. You need to go to a Chrysler garage with a Starscan tool. Otherwise the rear screens and roof-DVD-player will still be region 1. It will only take 5 minutes. Email us for instructions.
